L2 ANSWER 13 OF 13 SCISEARCH COPYRIGHT 2004 THOMSON ISI on STN DUPLICATE 8
AB In studies of the bioluminescence of 11 species of phengodid collected
in central and southeast Brazil, we have found that: (1) their lateral
lanterns emit light in the yellow-green region (λ_{max} = 540-580 nm)
and the head lantern color is shifted to the red region (λ_{max} =
565-620 nm), (2) the luciferins of both types of lanterns are identical to
that of lampyrids and elaterids and (3) the ***luciferase***
physicochemical properties are also similar to those of lampyrids and
elaterids (optimum pH ca 8.1; $K(m)(\text{ATP})$ = 260-370 μM , $K(m)(\text{luciferin})$ =
170-400 μM , molecular weight ca 60 kDa; apparent activation energy of in
vitro bioluminescence ca 58 kJ/mol). Thus the bioluminescence system of
phengodids appears to be essentially the same as that of lampyrids and
elaterids. The different bioluminescence colors of the lanterns of
Phrixothrix species (λ_{head} = 600-620 nm; λ_{lateral} =
535-565 nm) and other phengodid species are probably elicited by the
presence of ***luciferase*** isoenzymes, as occurs in the case of
elaterid prothoracic and abdominal lanterns.
